### Climate Change and it's extreme effects IPCC Update: Selected Assessments

#### Sebastian H. Mernild

Ph.D. & Dr. Scient., Professor in Climate Change Head of SDU Climate Cluster, University of Southern Denmark (SDU)

SDU & INTERGOVERNMENTAL PANEL ON Climate change IPCC Lead Author, AR6 (2018–2023) IPCC Contributing Author, AR5 (2009–2013)

# Vores klima er i forandring – også i Europa

AR6 Synthesis Report Climate Change 2023

CO2 concentration is today higher than at any time in at least 2 million years Cumulative net CO2 emissions: About 42% occurred between 1990–2019 Human activities have unequivocally caused global warming of 1.1°C since 1850–1900

Surface temperature has increased fast since 1970, looking back 2000 years Human-caused climate change is affecting extremes in every region across the globe Human influence was very likely the main driver of sea level rise increases, since at least 1971

IPCC WGI Interactive Atlas: Regional information (Advanced)

Light / dark area: Spread P10-P90 / P25-75

Without a strengthening of policies, global warming of 3.2°C is projected by 2100: Overshoot will occur

The best estimate of reaching 1.5°C of global warming lies in the first half of the 2030s

#### AR6, WG1 (2021):

# Estimated remaning carbon budgets from the beginning of 2020 (GtCO2).....it is about likelihood!

Approximate global warming relative to 1850–1900 until temperature limit (°C) <sup>a</sup>	Estimated remaining carbon budgets from the beginning of 2020 (GtCO <sub>2</sub> ) <i>Likelihood of limiting global warming</i> <i>to temperature limit</i> <sup>b</sup>					
	17%	33%	50%	67%	83%	
1.5	900	650	500	400	300	
2.0	2300	1700	1350	1150	900
